Preparing for Teaching and Learning

FS 1 FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

SPARK Your Interest

This Episode emphasizes the principles of learning which must be applied to ensure quality instruction. It also focuses on the intended learning outcomes which set the direction of the lesson. They must be (SMART) **S**pecific, **M**easurable, **R**ealistic, and **T**ime-bound) and formulated by time-tested principles. it also determines the teaching method used by the Resource Teacher whether (inductive or deductive) which is the practical realization or application of an approach. This episode dovetails with the course on Facilitating Learner-Centered Teaching.

TARGET Your Intended Learning Outcomes

At the end of this episode, I must be able to:

- Identify the teaching-learning practices that apply or violate the principles of teaching-learning;
- Determine the guiding principles on lesson objectives/learning outcomes applied in instruction;
- Judge if lesson objectives/intended learning outcomes are SMART;
- Determine whether or not the intended learning outcomes are achieved at the end of the lesson;
- Observe the teaching methods used by the Resource Teacher; and
- Differentiate the different methods of teaching.

FS 1 FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

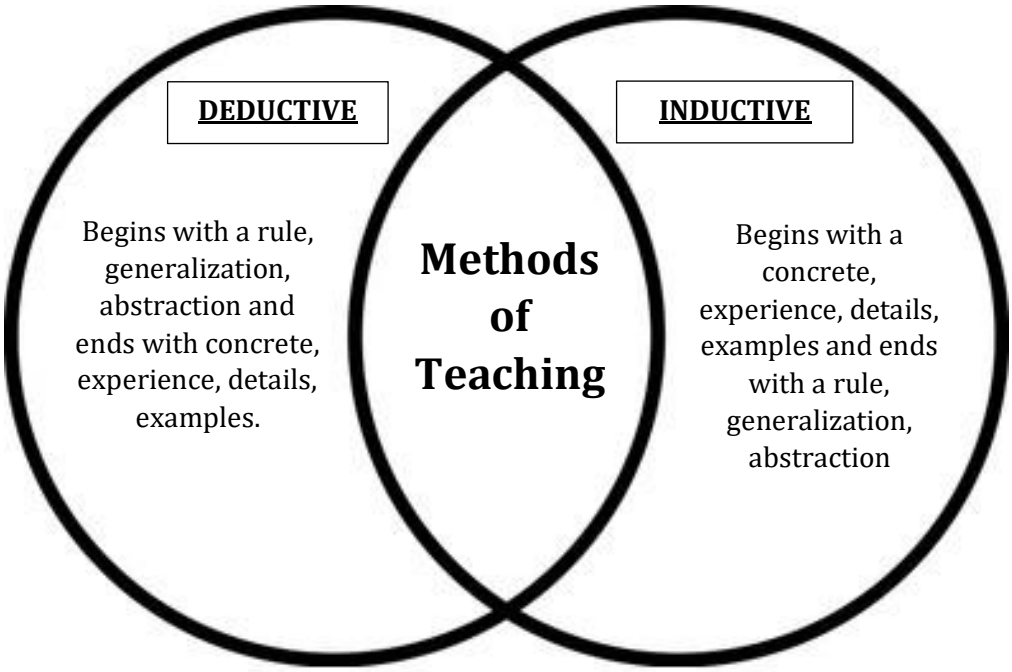

Episode 9 Preparing for Teaching and Learning

REVISIT the Learning Essentials

These are the time-tested principles of teaching and learning;

1) Effective learning begins with setting clear expectations and learning outcomes.
2) Learning is an active process. "What I hear, I forget, what I see, I remember; what I do, I understand."
3) Learning is the discovery of the personal meaning of ideas. Students are allowed to connect what they learned with other concepts to learn with real-world experiences and with their own lives.
4) Learning is a cooperative and collaborative process.

A teaching method consists of systematic and orderly steps in the teaching-learning process. It is a practical realization or application of an approach. All methods of teaching can be classified either as deductive (direct) or inductive (indirect).

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

OBSERVE, ANALYZE, REFLECT

Activity 9.1

Demonstrating an Understanding of Research-Based Knowledge Principles of Teaching and Learning

Resource Teacher: **ROMMEL B. MANANING JR.** Signature: _____ School: **ABAÑO LABORATORY SCHOOL**

Grade/Year Level : **GRADE 9** Subject Area : **SCIENCE** Date: **AUGUST 28, 2026**

OBSERVE

Observe a class with the use of principles of learning given in Revisit the Learning Essentials. I will identify evidence of applications/violations of the principles of learning. I can cite more than one piece of evidence per principle of learning.

Principles of Learning	What did the Resource Teacher do to apply the principle of learning
1. Effective learning begins with the setting of clear and high expectations of learning outcomes.	The resource teacher clearly presented the three lesson objectives (cognitive, psychomotor, and affective) in the presentation. The students were give. Specific tasks related to the topic and were expected to participate, answer questions, and present their ideas in front of the class.

2. Learning is an active process.	The Resource teacher involved the students in active learning activities rather than relying only on discussion. Students participated in the motivational activity, answered questions, shared their ideas, and presented their outputs.
3. the discovery of personal meaning and relevance of ideas.	The Resource teacher connected the lesson to real-life observations and experiences, such as asking students how Earth can constantly change even though it appears to be solid and stable. The activity about "Earth in Motion" also encouraged the students to relate the lesson to what they observed in their surroundings.
4. Learning is a cooperative, but a collaborative process. Learning is enhanced in an atmosphere of cooperation and collaboration.	The Resource Teacher allowed students to work together in groups during activities. Students discussed their ideas, completed tasks together, and presented their group outputs. This encouraged cooperation, communication, and sharing of ideas among classmates.

ANALYZE

1) What principles of learning were most applied? least applied?

Most applied

- I believe that the principle of learning that was most applied during my observation was "learning is sn active process". This was evident because the students were not simply listening to the teacher throughout the lesson. They were encouraged to participate, share their ideas, answer questions, and take part

in different class discussions. The teacher created opportunities for their students to share what they already knew and connect it sith the new concepts being discussed.

I also believed that this principle is especially important in Science because learning in Science goes beyond simply memorizing theories and definitions. Students learn better when they are given opportunities to explore, ask questions, share their observations, and relate scientific concepts to real-life experiences. During the observation, the students were actively involved in activities and discussions that allowed them to think about how the concepts applied to the world around them. This made the lesson more meaningful because they were not only receiving information but also making sense of it through their own experiences and ideas.

As a future teacher, I relaized that students learn best when they are given an active role in the learning process. It is important for the teacher to serve not only as aspirce of information but also as a facilitator who encourages students to think, participate, and discover.

Least applied

- I believe that none of the principles of learning was least applied because they were all well-balanced and effectively integrated into the discussion. The teacher provided opportunities for active participation, connected the kesson to meaningful experiences, encouraged collaboration, and gave clear expectations for their activities. Because each principle was given proper attention, the lesson was organized, engaging, and meaningful for the students, contributing to an effective and efficient learning experience.

Give instances where this/these principles/s could have been applied?

- Since I observed that all the principles were already applied, there was no particular principle was noticable lacking.

From among the principles of learning, which one do you think is the most important?

- Among all the principles of learning, I believe that “the discovery of personal meaning and relevance of ideas” is the mist important. Students learn more deeply when they can connect what they are learning to their own experiences and the world around them. It encourages them to think critically, ask questions, and discover answers rather than simpky memorize concepts.

This is particularly important in Science, because Science is more than just about theories, facts, and definitions. It is something we encounter in our everyday lives. When students can see how a scientific concepts applies to real-life situations, the lesson becomes more meaningful and easier to understand. For me, true learning happens students cam say, "I understand because I can see it and relate it to the real world"

Episode 9 Preparing for Teaching and Learning

Activity 9.2

Identifying Learning Outcomes that are Aligned with Learning Competencies

Resource Teacher : **ROMMEL B. MANINANG JR.** Signature: _____ School: **ABAÑO LABORATORY SCHOOL**

Grade/Year Level : **GRADE 9** Subject Area : **SCIENCE** Date: **AUG. 28, 2026**

OBSERVE

Observe a class, this time focusing on how the learning outcomes were stated. Determine if the learning outcome/s was/were achieved or not. Give evidences.

1. Write the learning outcomes stated in the lesson.

Learning Outcomes	(SMART Objectives)		Achieved	
	Yes	No	Yes	No
1) Describe nd differentiate the three tpyes of plate boundaries—convergent, divergent and transform—based on their movement and characteristics.	/		/	
2) Appreciate the importance of understanding plate boundaries in explaining changes and natural events occuring on earth's surface.	/		/	
3) Illustrate the movement of tectonic plates at convergent, divergent and transform boundaries using simple diagram or model.	/		/	

2. Cite pieces of evidences that these learning outcomes were achieved.

1) The students were able to explain in front of the class the difference of the three types of plate boundaries.
2) They also were able to illustrate the movement of tectonic plates using models.
3) The students were also able to provide real-life example of the changes that happened during the movement of plate tectonics.

ANALYZE

1) Do SMART objectives make a lesson more focused?
   - Yes. SMART objectives make a lesson more focused because they clearly identify what students are expected earn and accomplish within a specific period. They help the teachers choose appropriate learning activities, teaching strategies, and assessments that are aligned with the intended outcomes. Since SMART objectives are specific, measurable, achievable, relevant, and time-bound. They also make it easier for both teachers and students to determine whether the lerning goals.

REFLECT

Reflect on the

Lessons learned in determining SMART learning outcomes.

- I learned that SMART learning outcomes help make a lesson more focused, clear, and purposeful. Learning outcomes should clearly state what students are expected to learn and accomplish, while being specific, measurable, achievable, relevant and time-bound. I also learner that the outcomes should match the teaching strategies and assessment activities so that students are given appropriate opportunities to demonstrate their learning. Most importantly, well-defined SMART outcomes help teachers monitor students' progress and determine whether the intended learning goals are achieved.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

ANALYZE, REFELCT

Activity 9.3

Distinguishing Between Inductive and Deductive Methods of Teaching

Resource Teacher : **ROMMEL B. MANINANG JR.** Signature: _____ School: **ABAÑO LABORATORY SCHOOL**

Grade/Year Level : **GRADE 9** Subject Area : **SCIENCE** Date: **AUG. 28, 2026**

I will observe one Resource Teacher with the use of this observation sheet. Using the guide questions, I shall reflect on my observations and analysis.

Teacher-centered	Student-centered
Did the teacher lecture all the time? - The teacher was always present in the class.	Were students involved in the teaching-learning process? How? Or were they mere passive recipients of instructions? - Yes. The students are welcome to ask any questions. The students were eere also asked about what they have learned. Hence, the students are very much involved in the lesson.
Was the emphasis on the mastery of the lesson or on the test? Prove. - The emphasis on the mastery of the lesson was determined through being able to explain the difference between the	Was the emphasis on the students' application of the lesson in real life? Give proofs. - The students were asked about the result of the movement of the playe boundaries. They

three plate boundaries and creating models of the movement of plate boundaries.	were able to give examples of the earthly processes.
Was class atmosphere competitive? Why? - No. I have observed that they prefered working together in groups.	Was class atmospehere collaborative? Why? - Yes. Because the students were very collaborative. They are open to working together as a group and everyone chips in and help with the tasks.
Did teacher focus only on one discipline/subject? - Yes. The teacher focused solely on Science.	Did teacher connect lesson to other disciplines/subjects? - No. But he explained the real-world scenarios and result of these earthly processes.

ANALYZE

1. What are the possible consequences of teaching purely subject matter for mastery asn for the test?

- Teaching purely for mastery and test performance may result in students gaining knowledge mainly for the purpose of passing an exam father than truly understanding and applying what they have learned. Although students may memorize concepts and perform well on tests, they my struggle to connect those concepts to their own experiences and to situations outside the classroom. This can limit the reflective nature of learning, where students are encouraged to think about what they have learned, why it matters, and how they can use it in real life. I belive this is especially important for Science learning because Science is not only about memorizing concepts, facts, and theories. It is also about understanding how these ideas explain the world around us. When the students are given the opportunity to relate lessons to real-world experiences, conduct observations, ask questions, and apply what they have learned, the knowledge becomes more meaningful and easier to remember. Therefore, while preparing students

for mastery and tests is important, teaching should go beyond examination results and help student develop a deeper understanding that they can carry and apply to their everyday lives.

2. If you were to reteach the classes you observed, would you be teacher-centered of student-centered? Why?

- If I were to reteach the class I observed, I will be student-centered because I believe that the students must always come first and the students should always be the heart of the teaching and learning process. As a teacher, I would make their needs, abilities, interests, and experiences one of my of my priorities. Instead of simply giving them information p, I would give them opportunities to participate, ask questions, share their ideas, work on their classmates, and discover concepts on their own. I believ that students learn better when they are actively involved rather than just listening to their teachers. I would also consider the different factors that may affect their learning such as their prior knowledge, learning pace, confidence, and individual differences. My role as a teacher is not only to provide knowledge but also to guide, encourage, and support students.

REFLECT

Reflect on Principles of teaching worth applying

- A teaching principle worth apply is “teaching should consider the individual differences and needs of learners”. As a future teacher, I believe that students have different abilities, interests, learning styles, and level of understanding. Therefore, I believe that I should not expect that all students to learn in the same way or at the same time or pace. I should use different teaching strategies, activities, amd learning materials to make lessons accessible and meaningful to everyone. By being flexible and responsive to my students’ needs, I can create a supportive classroom where every learner feels valued, included, and encouraged to participate.

What teaching-learning practice shows that teaching approach was:

a) Constructivist – connected to past experiences of learners; learners constructed new lesson meanings

- The teacher connected the lesson to students' understanding and real-life experiences. Students were asked about what they had learned and were able to explain the difference among the three plate boundaries and their effects on Earth.

b) Inquiry-based

- The teacher used questioning throughout the lesson to encourage the students to think, explain their ideas, and discover the concepts about tectonic plate boundaries.

c) Developmentally appropriate – learning activities fit the developmental stage of children

- Their activities were appropriate for the students' level use the teacher used simple explanations, questions, group activities, and models to help them understand the movement of tectonic plates.

d) Reflective

- Students were given opportunities to think about and explain what they have learned. They were able to discuss the differences among the three plate boundaries and relate them to chamges occurring on Earth.

e) Inclusive – No learner was excluded; teacher taught everyday.

- The teacher created an environment where students were welcomed to ask questions and participate in the lesson. No student was intentionally or unintentionally excluded from the learning activities.

f) Collaborative – students worked together.

- The approach was collaborative because students worked together in groups. They helped one another in completing the tasks amd creating models of plate movement.

g) Integrative – lesson was multidisciplinary -e.g. In Science, Math concepts were taught.

- The lesson was mainly focused on Science, but the Teacher connected the concepts to real world situations, such as earthquakes and other geological events. Although it was not stronly integrated with another subject, the connection to real-life experiences made the lesson meaningful.

Topic	Plate Tectonics and Evidence of Plate Motion	Divergent Plate Boundaries	Convergent and Transform Plate Boundaries	Skills Lab: Modeling Plate Boundaries	Plate Boundaries in the Philippines and Lesson Wrap-Up
Objectives	At the end of the lesson, the students should be able to: a) Describe plate tectonics and the movement of lithospheric plates. b) Differentiate continental drift theory and slab pull theory c) Identify evidence that supports plate movement.	At the end of the lesson, the students should be able to: a) Identify divergent plate boundaries. b) Explain the formation of mid-ocean ridges and rift valleys c) Describe seafloor spreading and the formation of new crust.	At the end of the lesson, the students should be able to: a) Identify the different types of convergent plate boundaries b) Explain subduction and the formations associated with convergent boundaries. c) Describe transform boundaries and their association with earthquakes.	At the end of the lesson, the students should be able to: a) Model transform, convergent, and divergent plate movements. b) Describe the geologic features associated with each plate boundary type. c) Explain possible effects of plate movement on people and the environment.	At the end of the lesson, the students should be able to: a) Identify the types and locations of Philippine Sea Plate boundaries. b) Analyze topographical and geological evidence along the Philippine Sea Plate boundary. c) Summarize plate boundary types and their
